

SUMMARY

Cloud & DevOps Engineer with hands-on experience in building secure, scalable, and automated cloud infrastructure on AWS. Strong expertise in CI/CD pipeline design, containerization, DevSecOps integration, and infrastructure as code. Proven ability to reduce deployment failures, improve release speed, and strengthen cloud security using tools like Docker, Kubernetes, Terraform, Jenkins, GitHub Actions, Trivy, and SonarQube. Passionate about automation, reliability, and cloud security best practices.

EDUCATION

- Savitribai Phule Pune University
Dhole Patil College of Engineering, Pune (2022 - 2026) Bachelor of Engineering (IT) • 7.54 CGPA
- Kai Sau G.F Patil Jr College 12th • 78%
- Shri Mahavir English Medium School 10th • 62%

EXPERIENCE

- Neural Arc Inc
Cloud DevOps Intern Shivaji Nagar, Pune
Nov 2025 – Feb 2026

Cloud Infrastructure: Provisioned and managed AWS EC2, ECS (Fargate), ECR, IAM, CloudWatch, and Secrets Manager to deploy scalable cloud applications, reducing deployment time by 50% and improving infrastructure consistency across development, staging, and production environments.

DevOps & CI/CD: Built and optimized GitHub Actions pipelines for automated build, testing, Trivy security scanning, Docker image publishing to Amazon ECR, and deployment to AWS ECS, reducing manual deployment effort by 60%, cutting deployment time by 70%, and improving deployment success rates.

Containerization & Deployment: Containerized front-end and back-end applications using Docker and deployed them on AWS ECS (Fargate), reducing environment setup time by 65% and improving deployment consistency across environments.

Security & Compliance: Integrated Trivy vulnerability scanning and AWS Secrets Manager into CI/CD pipelines, identifying vulnerabilities before deployment, reducing configuration risks by 50%, and enforcing secure IAM-based access controls across cloud resources.

Monitoring & Observability: Configured Amazon CloudWatch for centralized logging, monitoring, dashboards, and real-time alerting, reducing Mean Time to Resolution (MTTR) by 30% and improving incident detection through proactive monitoring.

PROJECTS

- AWS
 - Deployed the Java Spring Boot Board Game application on AWS EC2, enabling cloud-based access to the web application.
 - Configured the EC2 runtime environment with Java, Maven, and required dependencies for application deployment.
 - Managed application accessibility through server configuration and exposed ports for external users.

- Red Hat Enterprise Linux (RHEL)
 - Performed Linux system administration tasks including user/group management, file permissions, package management using RPM, YUM, and DNF.
 - Managed processes, systemd services, SSH access, cron jobs, shell scripts, networking, firewall, SELinux, ACLs, LVM, NFS, and swap configuration.
 - Handled disk partitioning, filesystem management, boot process troubleshooting, log analysis, system monitoring, performance tuning, and issue resolution.
- Monitoring
 - Implemented a monitoring setup using Prometheus, Grafana, Alertmanager, and Node Exporter for Ubuntu WSL and Red Hat VM servers.
 - Configured Prometheus metric scraping from Node Exporter endpoints on port 9100 and visualized system metrics through Grafana dashboards on port 3000.
 - Set up Alertmanager alert routing and email notifications through Gmail SMTP for instance down, high CPU, memory, and disk usage alerts.
- Docker
 - Containerized the Spring Boot application using Docker with an OpenJDK base image.
 - Created a Dockerfile to package and run the Maven-generated Spring Boot JAR file on port 8080.
 - Prepared the application for portable deployment across local, cloud, and Kubernetes environments.
- Jenkins
 - Designed a Jenkins declarative CI/CD pipeline with Git checkout, Maven compile, test, build, and post-build stages.
 - Integrated SonarQube analysis, file system scan, and Quality Gate validation to enforce code quality before deployment.
 - Automated Nexus artifact publishing, Docker image build/scan/push, Kubernetes deployment, and deployment verification.
- GitHub Actions
 - Designed a GitHub Actions CI/CD workflow triggered on beta and production branches with manual workflow dispatch support.
 - Automated ARM64 Docker image builds using Docker Buildx and pushed images to Amazon ECR across Mumbai, Singapore, and Virginia regions.
 - Implemented branch-based ECS deployments, deploying staging from beta and multi-region production services from the production branch with service stability checks.
- Kubernetes
 - Created Kubernetes Deployment and Service manifests for deploying the containerized Spring Boot application.
 - Configured multiple application replicas to improve availability and support container orchestration.
 - Exposed the application using a Load Balancer Service, mapping external traffic to port 8080 inside the container.
- SonarQube
 - Configured SonarQube project properties for static code analysis.
 - Integrated SonarQube analysis into the Jenkins CI/CD pipeline.
